App Walkthrough Video — Recording Script

SecureWealth Twin · Punjab & Sind Bank Hackathon Series 2026

Target length	**4 minutes 30 seconds** — inside the 3–5 minute limit with 30 seconds of headroom
Narrators	**Narrator A** — intro, unique features, technology, closing · **Narrator B** — live demo and security. Suggested: A = Swayam, B = Vishwas (he owns the security rules).
Capture	Phone screen recording for the app; laptop screen recording for the admin dashboard. Two clips, spliced — do not film a phone with a camera.
Pace	Written for roughly 150 words per minute. Read at a normal conversational speed; do not rush to fit.

Everything in the SAY blocks is written to be read aloud as-is. It is deliberately plain: no adjectives you would not use in conversation, and no claim the app does not actually make on screen.

> **Before you press record — the one that will ruin a take.** Turn off the **Expo performance overlay**. It is visible in the corner of your current screenshots ('UI: 60.0 fps · 110 dropped · 2 stutters') and it will appear in every frame of the video. Shake the device or press `m` in the Metro terminal to hide it, then confirm on a test recording before doing a full take.

Pre-recording checklist

#	Do this	Why
1	Hide the Expo performance overlay	Otherwise it is burned into the whole video
2	`ollama run llama3`, then close the prompt	A cold model adds ~30s on the first explanation and looks like a freeze
3	Start the backend, run `smoke_test.sh`	Confirm the system is healthy before you commit to a take
4	`python scripts/seed_personas.py --reset-audit`	**Last.** The smoke test spends balance; reseeding restores pristine numbers
5	Do Not Disturb on, brightness 100%, screen timeout 10 min	No notification banners mid-take
6	Log in once and log out	Warms first-call paths. Do not invest — that spends balance again
7	Record a 20-second test and play it back with headphones	Catches overlay, audio level and mic noise before you waste a full take

1 Introduction 0:00 – 0:20

0:00 – 0:20 **Narrator A**

ON SCREEN App splash or login screen, still. Team name and the five names on a simple title card, or spoken over the login screen.

SAY We are **[TEAM NAME]** — Swayam, Mahak, Archit, Ayush and Vishwas. Our submission is SecureWealth Twin, a banking app where wealth advice and fraud defence run through one decision path, and where every decision can be explained to the customer in their own language.

2 Unique features 0:20 – 1:05

0:20 – 0:45 **Narrator A**

ON SCREEN Wealth tab for **Vishwas**, showing no product recommendation. Then cut to **Mahak** showing the emergency fund card.

SAY Three things make this different. First, our advice is allowed to say no. This customer earns sixty-two thousand and spends sixty-one thousand, so the engine recommends *nothing* and tells him to fix his expenses first. This customer has one point four months of savings, so she is told to build an emergency fund before any product. A wealth engine that cannot decline is a sales funnel.

0:45 – 1:05 **Narrator A**

ON SCREEN Cut to the admin dashboard Red Team tab, hovering over **Mass Forgery — 3 of 4 Copies**. Then to the phone showing a plain-language explanation card.

SAY Second, our audit trail survives an attack from inside the bank — even one that rewrites three of the four copies. And third, every security decision comes with a plain-language reason, generated on the bank's own hardware, in English, Hindi or Punjabi.

3 Live demo 1:05 – 3:10

This is the section they care about. Two full minutes of the real application. Move deliberately — a viewer needs a beat to read each screen. Do not narrate every tap; let the screen carry it.

1:05 – 1:25 **Narrator B**

ON SCREEN Register a new customer. Show the SecureWealth ID being issued. Log in with it.

SAY A new customer opens an account and is given a SecureWealth ID. They sign in with that ID and a six-digit MPIN — the phone number is never accepted as a login, so a leaked number is not a way in.

1:25 – 1:45 **Narrator B**

ON SCREEN Tap the Wealth tab — the **consent gate** appears. Grant consent. The wealth screen loads. Switch language English → □□□□□□ → □□□□□□.

SAY The wealth section is blocked until the customer grants consent to aggregate their accounts. That is the Account Aggregator rule enforced in code, not a checkbox. Once granted, the whole app — including the AI explanations — works in English, Hindi and Punjabi.

1:45 – 2:10	Narrator B
ON SCREEN As **Swayam**: invest ₹4,000. It completes. Show the balance updating.	
SAY Now a normal investment. Four thousand rupees is ordinary for this customer, so it goes straight through with no friction at all. Security that disturbs genuine customers has failed at its job.	

2:10 – 2:45	Narrator B
ON SCREEN Invest **₹95,000**. Verification screen appears. Open **what we checked**. Then **Verify another way**, switch MPIN → Security Question.	
SAY The same customer, ninety-five thousand. That is more than ten times his usual size, so the app asks him to verify before the money moves — and it shows him exactly which signals fired. If he cannot use one method, he can switch to another at the same level of assurance.	

2:45 – 3:10	Narrator B
ON SCREEN Start another large investment, then tap **I didn't start this**. Show the confirmation. Cut to the admin dashboard: run **Mass Forgery — 3 of 4 Copies**, show DEFENDED.	
SAY If it was not him, one tap stops the money and files a report. And on the bank side, this is an insider rewriting three of the four audit copies. Majority voting would accept that forgery. Ours does not — the one honest copy is cryptographically provable, and the tamper is reversed.	

4 Security highlights 3:10 – 3:50

3:10 – 3:30	Narrator B
ON SCREEN Admin dashboard: chain integrity seal showing valid, then the Audit Defence feed listing tamper and recovery events.	
SAY Every investment decision is written to an audit trail that is hash-chained, signed with Ed25519, and copied four times. Verification trusts the signature rather than the head-count, so forged copies fail no matter how many of them there are. The tamper and the repair are themselves recorded, so an incident survives its own fix.	

3:30 – 3:50	Narrator B
ON SCREEN Profile screen showing the registered device and the consent toggle.	
SAY On the access side: MPINs are hashed and never logged, sessions are token-based, every device is registered and carries a trust state, and the aggregation APIs refuse to answer without consent. Fraud is judged before the money moves, not reconciled afterwards.	

5 Technology highlights 3:50 – 4:15

3:50 – 4:15	Narrator A
ON SCREEN Optional: a single architecture slide, or keep the app on screen.	
SAY The backend is FastAPI and PostgreSQL. The app is React Native. Three models run on every investment: an XGBoost fraud classifier, a rules layer with published thresholds, and a PyTorch autoencoder trained only on legitimate behaviour, which flags patterns no rule anticipated. The language model that writes the explanations runs **locally** — customer financial data never leaves the bank's network to reach a third-party AI provider.	

6 Closing 4:15 – 4:35

4:15 – 4:35	Narrator A
ON SCREEN Return to the app home screen. Hold steady for the last two seconds.	
SAY For the customer: advice they can trust because it is willing to recommend nothing, security they can understand in their own language, and one tap to say this was not me. For the bank: fraud stopped before the money moves, and an audit trail that holds up against a privileged insider. Thank you.	

Timing and delivery notes

Note	Detail
Word budget	The script is **585 words**, about **3 min 54 sec** of speech at a natural 150 words per minute — comfortably inside the five-minute limit.
Where to cut	If a take runs long, drop the language switch at 1:25 and shorten the registration beat. Do **not** cut the suppressed-advice opening or the Mass Forgery attack — those are the two differentiators.
Where to slow down	The ₹4,000 versus ₹95,000 contrast at 1:45–2:45. That single comparison carries the whole fraud argument; give the viewer time to see both outcomes.

Note	Detail
Handover	A hands to B at 1:05, B hands back to A at 3:50. Record each narrator's audio separately and splice — far easier than getting one clean joint take.
Numbers on screen	Whatever you say must match what is visible. If a persona shows a different figure after a reseed, change the words, not the app.

Replace **[TEAM NAME]** in section 1 before recording, and confirm the spelling of every team member's name — the surnames used in the demo personas are fictional and should not be read aloud as anyone's real name.
